* Water Plant Types

Floating wetland plants float free on the surface of the water with roots dangling in the water

Submerged plants must be below the water surface of a pond—leaves will float on or above water surface. Submerged plants cannot survive out of the water.

Emerging plants have their roots and part of their stems below the water surface, and their leaves and flower above the water surface. They can be planted from 2-6" below the water surface or in an area of the garden that is most always moist. Do not fully submerge.

Bog plants can be planted 2" below the water surface or in an area of the garden that is most always moist (these are called "Marsh Gardens"). This is the largest variety of water plants available. Do not fully submerge but keep wet at all times, in mud or sand.

Marginal plants grow at the interface of wetland and upland habitats. They prefer changing water levels and develop their roots as the water rises over their root ball and recedes.

Landscape water plants cannot be planted directly in a pond. They are landscape plants that like wet to very-wet soil. Do not submerge.
